Laboratory animal research remains a very important part of basic research and drug development. With the worldwide increase in biotechnology, more and more researchers are required to use animals for research. However, many have basic or little training in experimental techniques or in the background information, which remains very important. This book rectifies the problem by providing animal researchers and technicians with the essentials for conducting their work in the

important model for human diseases and disorders. They comprise the majority of all experimental mammals and tend to be the model of choice used for research into many diseases/disorders including cancer, heart disease, asthma, Alzheimer's, Down syndrome, deafness, osteoporosis, obesity, diabetes and even mental health research. Additionally the laboratory mouse continues to play a widely publicized vital role in the human genome project. One of the most time-consuming activities in research laboratories is looking up information specific to the species or
