~~Materials. Embankments are often constructed using material obtained from a cutting. Embankments need to be constructed using non-aerated and waterproofed, compacted (or entirely non-porous) material to provide adequate support to the formation and a long-term level surface with stability.~~

Embankment (earthworks) - Wikipedia

2. Coarse-Grained Soil. Coarse-grained soils are used in structural fill zones, or shells, and in specialty filter and drain zones within embankments. Coarse-grained soils which usually consist of sand and gravel are also used in core zones, especially when the fines content is greater than 20 percent.

Embankments on Slopes and Hillside. Before embankments are placed on natural soil slopes, they must be prepared. These methods are also needed if the existing fill slopes are sharper than 4:1. To prepare the slope, benches of a minimum of 10 feet in width are cut into the slopes before the embankment fill is placed.

EMBANKMENTS | 1 Definitions of Embankments - YourDictionary

An embankment is any long ridge made out of soil or rock. Embankments are used, for example, to carry railways over river floodplains. Most embankments, however, are placed alongside rivers to hold them in during times when otherwise the rivers might flood. Very few are called 'The Embankment', the most famous being in London.
