Deep eutectic solvents (DESs) have recently attracted significant attention as inexpensive materials with similar characteristics to ionic liquids. For practical applications of DESs in electrochemical devices such as lithium-ion batteries (LIBs), the manipulation of the melting point and electrochemical stability is important as they are important parameters that determine device performance.

Lithium–oxygen (Li–O₂) batteries with high reversibility require a stable electrolyte against the side reactions with Li-metal anode and reactive oxygen species. Moreover, an electrolyte that can effectively utilize the low partial pressure of oxygen in the atmosphere has significant effect on the practical application of Li–air batteries.

Lithium-sulfur batteries are paid much attention owing to their high specific capacity and energy density. However, their practical applications are impeded by poor electrochemical performance due to the dissolved polysulfides. The concentration of soluble polysulfides has a linear relationship with the internal heat generation.
