Reflector antennas are widely used in radars, radio astronomy, satellite communication and tracking, remote sensing, deep space communication, microwave and millimetre wave communications, and so forth [1-3]. The rapid developments in these fields have created demands for development of sophisticated reflector antenna configurations.

A New Method of Designing Circularly Symmetric Shaped Dual ...

For both receiving and transmitting it is necessary to match the impedance of a microwave antenna to the feed line for efficient operation. Let us consider a typical antenna consisting of a dipole mounted in a parabolic dish reflector. The position of the antenna in the dish is set for maximum gain and minimum side lobes.

C band horn-reflector antennas on the roof of a telephone switching center in Seattle, Washington, part of the U.S. AT&T Long Lines microwave relay network. A microwave antenna is a physical transmission device used to broadcast microwave transmissions between two or more locations. [1]

Microwave antenna - Wikipedia

The optically transparent antenna consists of a radiation patch and a ground plane fabricated using AgHT-8. The antenna design comprises of rectangular shaped branches optimized to attain the wideband characteristics. The proposed antenna design has impedance bandwidth of 58.71% covering the frequency range of 23.92-43.8 GHz.

Compact wideband transparent antenna for 5G communication ...

The dipole antenna is the most fundamental and simplest antenna and was, historically, the first to be used as a reflector feed. To illuminate the reflector efficiently, a small circular disc was used as a subreflector to direct the dipole radiation toward the reflector. An oversized dipole reflector has also been used in place of the disc reflector.
